DOOR ENGINEERING INTRODUCES NEW CANOPY HANGAR DOOR

Door Engineering and Manufacturing, Kasota, Minn., is introducing its new Command Canopy Hangar Door. No additional structural engineering is required with this product, as it was designed to eliminate any header stress on the building. With standard pre-engineered sizes as well as custom design sizes, this door will fit existing or new buildings.

The Command Canopy Hangar Door uses simple and dependable stand-alone electric operators with less moving parts and cannot be opened beyond its limits. This door was designed for operation in northern tier states. With the initial vertical range of motion, snow is no problem. The door locks in any position, so there is no need for an auxiliary locking mechanism.

A standard battery back-up system ensures that the Command Canopy Hangar Door will open or close every time. The door also features remote control operation and a seamless weather-tight seal. Optional personnel doors and windows are also available.
