FIRE STATION FOUR-FOLD DOOR SYSTEMS

Four-fold door systems from Door Engineering and Manufacturing, Kasota, Minn., are ideal for fire station applications. These door systems offer a combination of long service life and low maintenance, while providing high-speed and high-cycle operation. Four-fold door systems are designed in standard sizes, but can also be customized for large openings and unique applications. The door panels fold completely clear of the opening in less than 7 seconds and are visible by drivers during their entire operation, thereby eliminating costly damage to both the doors and vehicles.

The four-fold door systems are available for use in hurricane zones. The FF700 has passed testing requirements for use in High Velocity Hurricane Zones. The testing covers Miami/Dade County and Broward County in addition to the entire state of Florida. The FF700 is rated for up to 65psf design pressure. The test protocol also included Large-Missile Impact testing.
